

Assignment Number A05

Name: Tejas Dattatray Mote

Branch: Computer Engineering

Roll number: BCA-09

Subject: Design Analysis of Algorithms

```
#!/usr/bin/env python3

# Python program to solve N Queen
# Problem using backtracking

global N
N = (int(input("Enter numbers of squares on board: ")))

def printSolution(board):
    for i in range(N):
        for j in range(N):
            print (board[i][j],end=' ')
        print()

# A utility function to check if a queen can
# be placed on board[row][col]. Note that this
# function is called when "col" queens are
# already placed in columns from 0 to col -1.
# So we need to check only left side for
# attacking queens
def isSafe(board, row, col):

    # Check this row on left side
    for i in range(col):
        if board[row][i] == 1:
            return False

    # Check upper diagonal on left side
    for i, j in zip(range(row, -1, -1), range(col, -1, -1)):
        if board[i][j] == 1:
            return False

    # Check lower diagonal on left side
    for i, j in zip(range(row, N, 1), range(col, -1, -1)):
        if board[i][j] == 1:
            return False

    return True

def solveNQUtil(board, col):
```

```

# base case: If all queens are placed
# then return true
if col >= N:
    return True

# Consider this column and try placing
# this queen in all rows one by one
for i in range(N):

    if isSafe(board, i, col):
        # Place this queen in board[i][col]
        board[i][col] = 1

        # recur to place rest of the queens
        if solveNQUtil(board, col + 1) == True:
            return True

        # If placing queen in board[i][col]
        # doesn't lead to a solution, then
        # queen from board[i][col]
        board[i][col] = 0

# if the queen can not be placed in any row in
# this column col then return false
return False

# This function solves the N Queen problem using
# Backtracking. It mainly uses solveNQUtil() to
# solve the problem. It returns false if queens
# cannot be placed, otherwise return true and
# placement of queens in the form of 1s.
# note that there may be more than one
# solutions, this function prints one of the
# feasible solutions.
def solveNQ():
    board = [[0 for i in range(N)] for j in range(N)]

    if solveNQUtil(board, 0) == False:
        print ("Solution does not exist")
        return False

    printSolution(board)
    return True

# driver program to test above function
solveNQ()

# This code is contributed by Divyanshu Mehta

```

Program 1: Program for implementing n-queen problem using Backtracking

```
code — bash — 92x27
tejasmote@Tejass-MacBook-Air:~/Documents/Latex Documents/Assignment 05/code$ ./code.py
Enter numbers of squares on board: 4
0 0 1 0
1 0 0 0
0 0 0 1
0 1 0 0
tejasmote@Tejass-MacBook-Air:~/Documents/Latex Documents/Assignment 05/code$ ./code.py
Enter numbers of squares on board: 6
0 0 0 1 0 0
1 0 0 0 0 0
0 0 0 0 1 0
0 1 0 0 0 0
0 0 0 0 0 1
0 0 1 0 0 0
tejasmote@Tejass-MacBook-Air:~/Documents/Latex Documents/Assignment 05/code$ █
```

Figure 1: Output of The Program
